MAME DIARRA TOURE

PhD Candidate in Mathematics and Statistics, McGill University
Montréal, Canada · +1 579 589 1038 · mame.toure@mail.mcgill.ca · arradiat.github.io

Seeking full-time Research Scientist positions starting Spring/Fall 2027

RESEARCH INTERESTS

Bayesian deep learning; trustworthy AI; scalable variational inference; uncertainty quantification for neural networks; low-rank and structured approximations; time-series foundation models; graph neural networks; molecular machine learning; out-of-distribution detection; AI for health, AI for science.

EDUCATION

McGill University, Montréal, Canada 2022 – 2027 (expected)
PhD Candidate in Mathematics and Statistics (Supervisor: Prof. David A. Stephens)

- **Expected graduation:** Spring 2027.
- **Thesis:** Scalable Bayesian Deep Learning for Uncertainty Quantification.
- Developing low-rank variational factorizations of neural-network weight matrices that reduce parameter count and training cost while producing calibrated predictive distributions.
- Applications to time-series forecasting, out-of-distribution detection, and calibrated prediction under distributional shift across MLPs, LSTMs, and Transformers.
- Studying complexity adaptation to match model capacity to data structure, and per-class epistemic uncertainty decomposition for safety-critical classification.

Université Paris-Saclay, France 2019 – 2021
MSc in Quantitative Finance – First Class Honours (Ranked Top 5%)

- Coursework: Stochastic Calculus, Monte Carlo Methods, Numerical Analysis, Optimization, Statistical Modeling, Partial Differential Equations, Deep Learning, Stochastic Control, Derivatives Pricing, Interest Rate Modeling.
- **Thesis:** Mathematical modeling of systemic exposure to central counterparties using Monte Carlo simulation methods (conducted at BNP Paribas Global Markets; see Professional Experience).

ENSIIE (Grande École), Évry, France 2018 – 2021
Engineering Degree (Diplôme d'Ingénieur) in Applied Mathematics & Computer Science

- Operations Research: Scheduling, Dynamic Programming, Network Flows, Branch and Bound, Linear and Integer Programming.
- Machine Learning, Numerical Optimization, Stochastic Calculus, Numerical Analysis, Statistical Modeling, Simulation Methods.

Université d'Évry Val d'Essonne (Université Paris-Saclay), France 2018 – 2019
BSc in Mathematics – First Class Honours (Ranked Top 5%)

- Double degree completed concurrently with ENSIIE engineering studies.
- Coursework in real analysis, algebra, measure theory, probability, topology, and mathematical optimization.

Classes Préparatoires aux Grandes Écoles (MPSI / MP) 2016 – 2018
Lycée Sainte Croix Saint Euverte, Orléans, France

- Intensive two-year programme in advanced mathematics, physics, and computer science preparing for the national competitive entrance examinations (Concours) to top French engineering schools.
- Ranked first in cohort. Successfully passed the Concours for Grandes Écoles.

RESEARCH & PUBLICATIONS

Singular Bayesian Neural Networks Accepted at ICML 2026 · project page
M. D. Toure, D. A. Stephens. Proposes a low-rank variational inference framework for Bayesian neural networks that parameterizes each weight matrix as a product of two smaller factor matrices, each carrying a learned posterior distribution. Reduces parameter complexity while producing calibrated uncertainty estimates and establishes PAC-Bayes generalization bounds that scale with the chosen rank. Validated across MLPs, LSTMs, and Transformers with strong out-of-distribution detection and prediction interval coverage, matching Deep Ensembles at up to 30× fewer parameters.

Not Just How Much, But Where: Per-Class Epistemic Uncertainty Accepted at UAI 2026 · project page
M. D. Toure, D. A. Stephens. Decomposes model uncertainty into per-class epistemic contributions via a novel vector-valued metric, enabling systems to identify which specific class predictions are unreliable rather than flagging overall uncertainty. Applied to safety-critical classification (diabetic retinopathy grading) where it distinguishes catastrophic misses from severity underestimates that are invisible to standard scalar uncertainty measures.

When Does a Low-Rank BNN Certify Its Deterministic Center? Accepted at SPIGM Workshop, ICML 2026
M. D. Toure, D. A. Stephens. Investigates the conditions under which a low-rank Bayesian neural network provides theoretical guarantees on its deterministic (MAP) center, characterizing the geometry and rank constraints under which the variational posterior certifies the quality of the point estimate. Connects low-rank factorization structure to generalization certification via PAC-Bayes arguments.

Evaluating the Ranking Layer of Rare-Disease Decision Support: Bayesian Uncertainty Under Temporal and Patient Shift Accepted at GenAI for Health Workshop, NeurIPS 2026 · project page

M. D. Toure, B. F. P. Dossou. Evaluates the variant-ranking layer of rare-disease decision support under temporal and patient shift, comparing deterministic baselines, deep ensembles, SBNNs, and Bayes-by-Backprop. Wide rank-50 SBNN gives the best temporal ClinVar ranking (84.35% top-1), ensembles the strongest unseen-gene OOD detection, and phenotype conditioning helps only where gene-disease evidence exists.

Modular Bayesian Foundation Models: Bayesian Time Series Encoders for OOD Detection, Routing and Forecasting Under review · project page

M. D. Toure, et al. Proposes a modular framework combining end-to-end Bayesian encoder training with label-free, uncertainty-based expert routing. Built on SBNNs, the encoder collection uses 63.8% less storage than its deterministic counterpart. Versus distance-based routing, improves ECE (0.086 to 0.072), NLL (0.907 to 0.836) and PICP90 (82.3% to 89.0%) at competitive MSE, and matches deep ensembles on forecasting accuracy with 92.8% fewer parameters.

Ongoing work

- **Bayesian Molecular graph neural networks:** Developing end-to-end low-rank Bayesian GNNs for uncertainty-aware molecular property prediction under scaffold shift. The project studies whether over-specified GINE architectures can reveal smaller viable low-rank Bayesian models, using spectral compressibility diagnostics, tapered layerwise rank allocation, embedding compression, rank-calibrated priors, and uncertainty–cost evaluation against deterministic GNNs, full MFVI Bayesian GNNs, SWAG, Deep ensembles, and post-hoc UQ baselines.

AWARDS & SCHOLARSHIPS

ISM Scholarship for Outstanding PhD Candidates Winter 2027

Institut des sciences mathématiques (ISM). Competitive scholarship awarded to **outstanding** doctoral students in their final year, selected across the consortium of eight Québec universities (including McGill, Université de Montréal, UQAM, Concordia, Laval), to support full-time concentration on thesis writing and defence preparation.

Mitacs Accelerate Fellowship May-December 2026

Mitacs. Competitive industry-academic research fellowship supporting doctoral research in collaboration with Hydro-Québec. Project focused on uncertainty-aware time-series foundation models for energy forecasting applications.

Mila Women in AI Excellence Scholarship 2024

Mila – Quebec AI Institute (EDI Scholarships Program). Competitive award recognizing outstanding research potential and commitment to safe, trustworthy AI among women in AI at the graduate level. Provides financial support and integration within Mila's research community.

Sophie Germain Excellence Scholarship 2020

Jacques Hadamard Mathematics Foundation (FMJH). Competitive international scholarship supporting exceptional students in the Paris-Saclay "Mathematics and Applications" Master's programme, awarded on the basis of academic excellence and research potential.

TALKS & PRESENTATIONS

AFSA Québec Scientific Day August 2026

Co-organizer and host, Association des Femmes Scientifiques Africaines du Québec, Montréal, Canada.

Not Just How Much, But Where: Decomposing Epistemic Uncertainty into Per-Class Contributions August 2026

Conference on Uncertainty in Artificial Intelligence (UAI 2026), Amsterdam, Netherlands.

Scalable Uncertainty Quantification for Safe and Trustworthy AI Systems July 2026

Women in Machine Learning (WiML) Symposium and Workshop, co-located with ICML 2026, Seoul, South Korea.

Singular Bayesian Neural Networks July 2026

International Conference on Machine Learning (ICML 2026), Seoul, South Korea.

Not Just How Much, But Where: Decomposing Epistemic Uncertainty into Per-Class Contributions June 2026

2nd Workshop: Uncertainty in AI, IVADO Thematic Semester – Statistical Foundations of AI, Montréal, Canada.

PROFESSIONAL EXPERIENCE

Hydro-Québec (IREQ – Institut de Recherche d'Hydro-Québec) May 2026 – Dec 2026

Research Scientist (Mitacs Accelerate Fellow)

- Adapting the Singular Bayesian Neural Network (SBNN) framework to self-supervised pretraining of Transformer encoders on large-scale industrial time series.
- The host pipeline comprises approximately 8,000 specialist encoders pretrained on hydroelectric sensor signals; each encoder is simultaneously compressed via learned low-rank weight factorizations and equipped with calibrated epistemic uncertainty through variational inference.
- Enabling principled encoder selection for downstream load forecasting and fault detection tasks, with calibrated predictive distributions supporting safety-critical operational decisions.
- Supported by a Mitacs Accelerate Fellowship (competitive industry-academic research fellowship).

Crédit Agricole S.A. (Inspection Générale), France Sep 2024 – Jan 2025

Quantitative Model Auditor

- Audited quantitative models across the Crédit Agricole group for robustness, governance, and regulatory compliance.

- Evaluated model sensitivity to input perturbations and identified weaknesses in uncertainty handling and calibration procedures.
- Produced diagnostic reports synthesizing technical findings and remediation recommendations for senior management and group risk committees.

JACOBB (Center for Applied AI), Montréal May 2022 – July 2024

Applied Research Scientist (Supervisors: P. Rosin, Dr. M. Coté)

- **Budget pacing (Reinforcement Learning):** Formulated a real-time budget allocation problem as constrained optimization and developed a Reinforcement Learning agent to pace advertising spend under operational constraints and stochastic demand.
- **Investor–startup matching (NLP):** Designed a collaborative filtering system to match startups with potential investors, addressing severe labeled-data sparsity through latent factor models.
- **Ingredient prediction (NLP):** Implemented topic modeling techniques for predicting dish ingredients for a food delivery company.
- Translated research prototypes into deployed solutions; contributed to internal R&D projects spanning NLP, recommendation systems, and optimization.

J.P. Morgan Chase & Co. Summer 2023

Quantitative Research Mentorship Program

- Competitively selected for J.P. Morgan's Quantitative Research Mentorship Program providing one-on-one mentorship with an experienced quantitative researcher.
- Worked on topics in quantitative analytics, financial engineering, and risk modeling.

Société Générale, Paris Nov 2021 – Feb 2022

Quantitative Analyst

- Contributed to the *Haussmann* project: a group-wide redesign of the internal Probability of Default (PD) and Loss Given Default (LGD) models used for credit risk assessment.
- Proposed a novel estimation approach for computing PD on portfolio segments with exceptionally low historical default rates, addressing the statistical challenge of inference under extreme data scarcity.

BNP Paribas (Global Markets), Paris May 2021 – Oct 2021

Quantitative Research Intern (Supervisor: D. Bastide)

- Developed a mathematical model to quantify the bank's exposure to central counterparties (CCPs), specifically modeling default-fund contributions to the various clearing houses to which BNP Paribas belongs.
- Built a Monte Carlo simulation framework for estimating exposure distributions; work formed the basis of the MSc thesis.
- Concurrently contributed to a project at Natixis applying neural networks to the pricing of Credit Valuation Adjustment (CVA) in high-dimensional settings.

LaMME (Laboratory of Mathematics and Modeling), Université d'Évry, France Summer 2019

Research Intern (Supervisors: Dr. S. Pulido, Dr. N. Brunel)

- Investigated kernel estimation techniques for Volterra processes in the context of rough volatility models.

TEACHING

McGill University Fall 2026 – Present

Head Teaching Assistant, Department of Mathematics and Statistics

- **MATH 140** (Calculus 1) and **MATH 141** (Calculus 2): coordinating a team of 20 teaching assistants.

McGill University Fall 2025 – Summer 2026

Graduate Teaching Assistant, Department of Mathematics and Statistics

- **MATH 139** (Calculus with Precalculus), **MATH 140** (Calculus 1), and **MATH 141** (Calculus 2): leading weekly tutorials, holding office hours, and providing individualized support on limits, differentiation, integration, and series.

COMMUNITY & MENTORSHIP

AFSA Québec (Association des Femmes Scientifiques Africaines du Québec): Member of the organizing committee and former representative at McGill University (since Summer 2023). AFSA supports incoming African female graduate students during their transition to Québec and motivates girls in home countries to pursue scientific studies in Québec universities.

Jiggen In STEM ("Women In STEM" in Wolof): Mentor supporting high school girls in Senegal pursuing STEM careers, drawing on personal experience navigating underrepresentation in mathematics.

Women in AI North America and **Association of Women in Mathematics**: Active member and mentee; benefiting from structured mentorship on research direction, career planning, and professional development.

TECHNICAL SKILLS

Programming: Python (PyTorch, TensorFlow, NumPy, Pandas, scikit-learn), C++, R, SQL
Methods: Bayesian Inference, Variational Methods, Monte Carlo Simulation, PAC-Bayes Theory, Low-Rank Matrix Factorization, Operations Research (LP, IP, DP, Network Flows), Numerical Optimization, Stochastic Calculus
Languages: French (Native), English (Fluent), Wolof (Native)
